TECHNICAL DATA SHEETS and RECOMMENDATIONS

www.ABER.pt

Manufacturer's Declaration

ABER ensures compliance of its products with the essential health and safety requirements of the harmonized standards EN ISO 12100:2010 and ISO 4413:2010

General information

ABER gear pumps are single fixed displacement pumps. They are available from 12 to 154 cm³/rev. over different range series. They can be assembled directly into the PTO, with the exception of the PTO of two shafts without support.

Features:

- Bidirectional
- Good performance
- Small dimensions
- Light
- Fast to mount
- Low noise
- Low weight
- Changeable direction of rotation (unidirectional version)

Pump selection

To ensure that the PTO will not be overloaded, and to get the correct flow requirements with the speed of the engine chosen, it is important to use a pump with the right capacity. Pump capacity (D), expressed in cm³/rev, can be calculated using the following formula:

$$D = \frac{Q \times 1000}{N \times Z}$$

D-Pump displacement [cm³/rev]

Q-Flow required [l/min]

N-Motor speed

Z-Engine to PTO ratio

In order not to overload the PTO's mechanical units, it is important to calculate the torque and power consumed by the pumps. Torque and power are calculated with the following formula:

$$M = \frac{D \times Pb}{63} \qquad P = \frac{D \times N \times Z \times Pb}{600 \times 0.90 \times 1000}$$

M-Torque [Nm]
Pb-Pressure [bar]
P-Power [kW]
N-Motor speed [rpm]

0,90-Pump efficiency (can change from one pump to another)

ATTENTION

If the calculated load exceeds the maximum allowed for the PTO, a different combination should be

selected.

Hose selection

In order to avoid intense heat generation and cavitation phenomenon that causes noise and pump deterioration, ABER recommends the following speeds and dimensions of the hoses.

Admission line

0,5...1 m/s

Return line

2...3 m/s

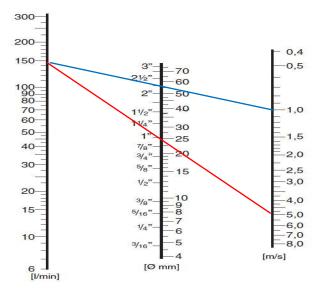

Pressure line

P = 0...50 bar - 3,5 m/s

P = 50...100 bar - 3,5...4,5 m/s

P = 50...100 bar - 3,5...4,5 m/s P = 150...200 bar - 5...5,5 m/s

P = 200...300 bar - 5,5...6 m/s

ATTENTION

The recommended speeds and dimensions specified may not be enough when temperatures are too

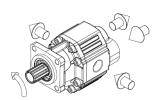

low, the tank is below the level of the pump, the inlet hose is long or there are many valves and fittings in the inlet hosing. In these cases we recommend increasing the diameter of the hoses, keeping the suction hose as short and straight as possible and reducing the pump rotation speed.

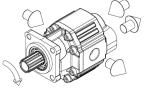

Direction of rotation

The direction of rotation of the pump must be according to the PTO rotation. ABER can supply bidirectional or unidirectional pumps

Left Hand (CCW)

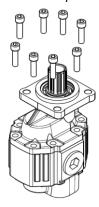

Right hand (CW)

Rotation sense is defined from drive shaft. Unidirectional gear pumps must be ordered CCW or CW

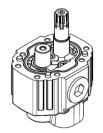

Changing the rotation

To change the rotation of the unidirectional pump it is necessary to follow the next steps.

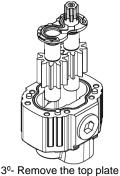

(B3 Series: example of how to change the rotation)

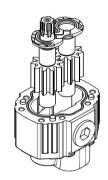

1º- Loosen and remove the top screws and washers

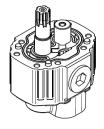

2º- Remove the cover. If the cover is stuck tap around the edge with a rubber mallet to disconnect the cover and the body

and the gears. The rear plate should not be removed. Remove first the main shaft to facilitate the removal of the top plate

4º- Reassemble the gears in the opposite position and the plate in the same position

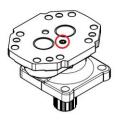

5°- With the use of grease, reapply the oring

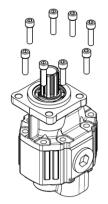

6°- Be sure that the plate seal is assembled on the pressure side (P side). Be aware that the seal tips should not be damaged when inserting the plate

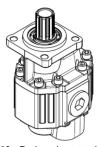

7º- Replace the hex bolt in the cover from one hole to another. Tighten the hex bolt with 20N.m torque

8º- Be aware that hex bolt stays in the pump pressure side (P side)

9°- Assemble the pump cover (turned 180° from it's original position) and tighten the top screws and washers with the 80 N.m

10° - By hand rotate the main shaft to ensure that the pump rotates freely. The pump is now ready for working with the original rotation reversed

Torque tightness plugs

3/4" BSP	60 N.m
1" BSP	75 N.m
1 1/4" BSP	115 N.m

Installation instructions

- 1. Check PTO direction of rotation and fit the pump according to PTO sense of rotation. Make sure that the assembly does not generate axial or radial load on the pump main shaft
- 2. Grease spline shaft with solid lubricant before installation when the PTO contains an output shaft seal. Connect the pump to the PTO (apply 80Nm torque in the tightening nuts). Elevated efforts or shocks are not recommended during the installation. The pump must be connected without making use of any type of tool that forces its assembly.

ATTENTION

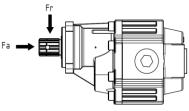

During the installation always leave the inlet port in a higher or equal level than outlet port. This increases the pump's life.

3. Remove all protection covers from the threaded holes (inlet/outlet). Apply the inlet and outlet fittings into the pump (ask for the tightening information's from the fittings manufacturer). Connect the outlet and the inlet pipes to the accessories (always respect recommended hoses dimensions and thread dimensions). Be sure that all connections are robust and well-sealed.

Axial and radial load

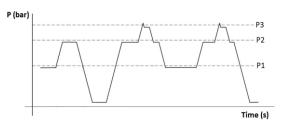

Gear pumps that are subjected to axial and radial loads (such as driving gears and couplings) must be fitted with double tapered roller bearings to support the loads (ABER reinforced gear pump versions)

In driving gear application and couplings use circlips and/ or washers with one M10 screw and locking fluid (70Nm).

Pressure definition

Maximum allowed pressure can change according to the time that the pump is under load. Continuous, intermittent and pike pressures can occur. For their maximum values and times consult technical sheet and, or contact ABER.

P1 – Continuous pressure

P2 - Intermittent pressure

P3 – Peak pressure

ABER is constantly engaged in improving its products and, therefore, reserves itself the right to modify without any further notice the characteristics shown

Fluids

For the gear pump range, ABER recommends the use of high quality mineral oil type ISO HM or DIN 51524-2 HLP, with viscosities from 20 to 40mm²/s (cSt) at working temperature. The recommended oil viscosity limits stay between minimum 10mm²/s (cSt) and maximum 100mm²/s (cSt). The maximum started viscosity at start up is 750 mm²/s (cSt). It is possible to use other oils with the same characteristics, but only after consulting and getting authorization from ABER. The designation 32, 46, 68, etc. denotes the viscosity at 40°C of the oil. When choosing the oil it is necessary to be aware of the low viscosity with the increase of the temperature, therefore, we recommend that when you want to work above that temperature, you should choose an oil with more viscosity (thicker) in order to compensate the reduction of viscosity when the temperature increases. The oil temperature must be maintained between-25°C and 80°C. We advise you to use an oil cooler when you verify that the system's temperature is higher than these values. The oil must be replaced after 1000 working hours or at least once a year, change filters elements as well.

Leakage safety system

ABER gear pumps do not need to use an exterior drain line because they are drained from the inside. These pumps have two shaft seals to guarantee protection avoid the oil exchange between the hydraulic circuit and the gear box. In case of failure, a safety system between the shaft seals of the pump allows the oil to escape, but doesn't allow the entry of contamination into the pump.

If any oil leaks out from the pump, stop the system immediately to determine the cause of the leak and correct the problem source.

Filtration

The filtration is extremely important and may influence or even determine the durability of the equipment. ABER recommends the use of a return filter and an air filter with an absolute filtration degree of $10\mu m$ if the pressure system is higher than 200 bar and an absolute filtration degree of $25~\mu m$ if the pressure system is lower than 200 bar, as according to the ISO 4406 class 18/13. The first filter to be applied into the system must be replaced as soon as it reaches the 50~working hours; after the first replacement, it must be replaced along with the oil or when uncommon pressures are verified in the return.

ATTENTION

Be sure that the whole system is perfectly cleaned before filling it with oil. Never mix water or other liquids, different oil qualities, viscosities or

brands with the oil in the system. Make sure that there was no gearbox contamination.

Faults; cause and remedies

Faults	Cause	Remedies				
	1.Empty tank	1.Fill tank with recommended fluid				
	2.Closed valve in inlet hose	2.Open valve				
	3.Air in inlet hose	3.Put tank above the pump level				
No oil flow	4.Wrong sense of rotation	4.Change pump rotation sense				
	5.Reversed hoses	5.Change inlet and pressure hoses				
	6.PTO not engaged	6.See "PTO Troubleshooting"				
	7.Pump damaged	7.Replace pump				
	1.Air in housing	1.Fill housing with recommended fluid				
Equipment works with	2.Air leakage in inlet hose	2.Repair air leakage				
irregular movements	3.Low oil level	3.Fill tank with recommended fluid				
	4.Pump damaged	4. Replace pump				
		1.Replace inlet hose for other with a larger				
		diameter				
	1.Cavitation	1.Remove inlet restrictions				
	2.Very thick oil	Check for clogged tank breather or clogged				
Pump is noisy	3.Air in inlet hose	admission filter				
	4.Pump damaged	2.Replace for an recommended fluid				
	in amp damaged	3. Put tank above the pump level, check air				
		pressure in the tank				
		4.Replace pump				
		1.Fill tank with recommended fluid				
	1.Low oil level	2.Replace for a bigger tank				
	2.Small tank	3.Replace oil and filter				
	3.Dirty oil	4.Adjust for equipment specifications or				
	4.Relief valve improperly set	replace if necessary				
Oil is too hot	5.Relief valve stuck in open position	5.Clean and re-set for equipment				
	6. Very thick oil	specifications				
	7.Too much flow	6.Replace for an recommended fluid				
	8. Undersized system	7.Reduce speed or replace for a smaller				
		displacement pump				
		Review application system

	on amp damaged	3.Replace pump				
		1.Tighten fittings and hoses, or replace if				
		necessary				
	1.From inlet/outlet lines	2.Stop the system immediately to determine				
	2.From drain hole	the cause of the leak and correct the problem				
Oil leakage	3. From shaft seal	source				
	4.From body sections	3. Replace shaft seal				
		4. Tighten bolts for specified torque, or				
		replace damaged oring or body				
		replace damaged only of body				

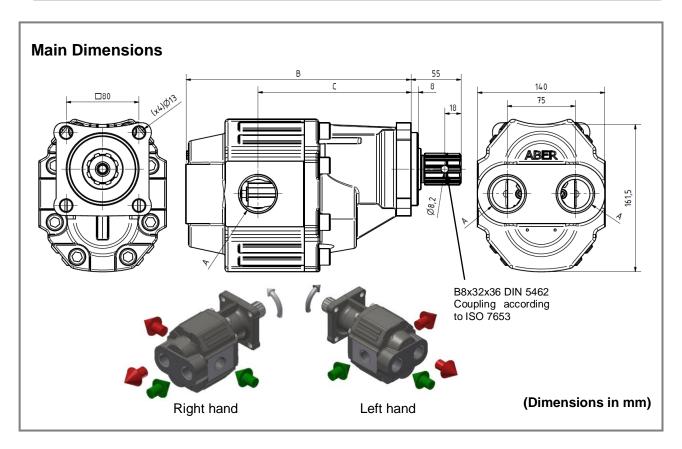

When the pump is working never touch or pull hoses or intermediate shaft when applied. When intermediate shaft is applied take into account that parts can be ejected.

The application of the pumps must follow all the instructions hereby mentioned in order to assure the safety of all personal working with the equipment including its surroundings, assure a long life to the product and preserve the warranty of the brand. All applications that do not follow the hereby

instruction are solely the users responsibility. If there should happen any malfunctioning, it is strictly forbidden the disassembly of the product except if it is being made by a qualified technician of the brand or if there is a special authorization to do so. If this specification should not be followed, all warranties might be lost.
